The fixed-point theorem essentially lets us define partial computable functions in terms of their indices. For example, we can find an index $e$ such that for every $y$,

$$\varphi_e(y) = e + y.$$ 

As another example, one can use the proof of the fixed-point theorem to design a program in Java or C++ that prints itself out.

Remember that if for each $e$, we let $W_e$ be the domain of $\varphi_e$, then the sequence $W_0, W_1, W_2, \ldots$ enumerates the computably enumerable sets. Some of these sets are computable. One can ask if there is an algorithm which takes as input a value $x$, and, if $W_x$ happens to be computable, returns an index for its characteristic function. The answer is “no,” there is no such algorithm:

**Theorem thy.1.** There is no partial computable function $f$ with the following property: whenever $W_e$ is computable, then $f(e)$ is defined and $\varphi_{f(e)}$ is its characteristic function.

**Proof.** Let $f$ be any computable function; we will construct an $e$ such that $W_e$ is computable, but $\varphi_{f(e)}$ is not its characteristic function. Using the fixed point theorem, we can find an index $e$ such that

$$\varphi_e(y) \simeq \begin{cases} 0 & \text{if } y = 0 \text{ and } \varphi_{f(e)}(0) \downarrow = 0 \\ \text{undefined} & \text{otherwise.} \end{cases}$$

That is, $e$ is obtained by applying the fixed-point theorem to the function defined by

$$g(x, y) \simeq \begin{cases} 0 & \text{if } y = 0 \text{ and } \varphi_{f(x)}(0) \downarrow = 0 \\ \text{undefined} & \text{otherwise.} \end{cases}$$

Informally, we can see that $g$ is partial computable, as follows: on input $x$ and $y$, the algorithm first checks to see if $y$ is equal to 0. If it is, the algorithm computes $f(x)$, and then uses the universal machine to compute $\varphi_{f(x)}(0)$. If this last computation halts and returns 0, the algorithm returns 0; otherwise, the algorithm doesn’t halt.

But now notice that if $\varphi_{f(e)}(0)$ is defined and equal to 0, then $\varphi_e(y)$ is defined exactly when $y$ is equal to 0, so $W_e = \{0\}$. If $\varphi_{f(e)}(0)$ is not defined, or is defined but not equal to 0, then $W_e = \emptyset$. Either way, $\varphi_{f(e)}$ is not the characteristic function of $W_e$, since it gives the wrong answer on input 0. \(\square\)
