

lam.1 Reduction of Lambda Terms

cmp:lam:red:
sec

What can one do with lambda terms? Simplify them. If M and N are any lambda terms and x is any variable, we can use $M[N/x]$ to denote the result of substituting N for x in M , after renaming any bound variables of M that would interfere with the free variables of N after the substitution. For example,

$$(\lambda w. xxw)[yyz/x] = \lambda w. (yyz)(yyz)w.$$

Alternative notations for substitution are $[N/x]M$, $M[N/x]$, and also $M[x/N]$ ^{digression}
Beware!

Intuitively, $(\lambda x. M)N$ and $M[N/x]$ have the same meaning; the act of replacing the first term by the second is called β -conversion. More generally, if it is possible to convert a term P to P' by β -conversion of some subterm, one says P β -reduces to P' in one step. If P can be converted to P' with any number of one-step reductions (possibly none), then P β -reduces to P' . A term that cannot be β -reduced any further is called β -irreducible, or β -normal. I will say “reduces” instead of “ β -reduces,” etc., when the context is clear.

Let us consider some examples.

1. We have

$$\begin{aligned} (\lambda x. xxy)\lambda z. z &\triangleright_1 (\lambda z. z)(\lambda z. z)y \\ &\triangleright_1 (\lambda z. z)y \\ &\triangleright_1 y \end{aligned}$$

2. “Simplifying” a term can make it more complex:

$$\begin{aligned} (\lambda x. xxy)(\lambda x. xxy) &\triangleright_1 (\lambda x. xxy)(\lambda x. xxy)y \\ &\triangleright_1 (\lambda x. xxy)(\lambda x. xxy)yy \\ &\triangleright_1 \dots \end{aligned}$$

3. It can also leave a term unchanged:

$$(\lambda x. xx)(\lambda x. xx) \triangleright_1 (\lambda x. xx)(\lambda x. xx)$$

4. Also, some terms can be reduced in more than one way; for example,

$$(\lambda x. (\lambda y. yx)z)v \triangleright_1 (\lambda y. yv)z$$

by contracting the outermost application; and

$$(\lambda x. (\lambda y. yx)z)v \triangleright_1 (\lambda x. zx)v$$

by contracting the innermost one. Note, in this case, however, that both terms further reduce to the same term, zv .

The final outcome in the last example is not a coincidence, but rather illustrates a deep and important property of the lambda calculus, known as the “Church-Rosser property.”
