One advantage to having the precise inductive description of the primitive recursive functions is that we can be systematic in describing them. For example, we can assign a “notation” to each such function, as follows. Use symbols zero, succ, and $P_i^n$ for zero, successor, and the projections. Now suppose $f$ is defined by composition from a $k$-place function $h$ and $n$-place functions $g_0, \ldots, g_{k-1}$, and we have assigned notations $H, G_0, \ldots, G_{k-1}$ to the latter functions. Then, using a new symbol Comp$_{k,n}$, we can denote the function $f$ by Comp$_{k,n}[H,G_0,\ldots,G_{k-1}]$. For the functions defined by primitive recursion, we can use analogous notations of the form Rec$_k[G,H]$, where $k+1$ is the arity of the function being defined. With this setup, we can denote the addition function by

$$\text{Rec}_2[P^1_0,\text{Comp}_1[\text{succ},P^3_2]].$$

Having these notations sometimes proves useful.
