

## rec.1 Primitive Recursion Functions

cmp:rec:prf: sec Let us record again how we can define new functions from existing ones using primitive recursion and composition.

cmp:rec:prf: defn:primitive-recursion **Definition rec.1.** Suppose  $f$  is a  $k$ -place function ( $k \geq 1$ ) and  $g$  is a  $(k+2)$ -place function. The function defined by *primitive recursion from  $f$  and  $g$*  is the  $(k+1)$ -place function  $h$  defined by the equations

$$\begin{aligned} h(x_0, \dots, x_{k-1}, 0) &= f(x_0, \dots, x_{k-1}) \\ h(x_0, \dots, x_{k-1}, y+1) &= g(x_0, \dots, x_{k-1}, y, h(x_0, \dots, x_{k-1}, y)) \end{aligned}$$

cmp:rec:prf: defn:composition **Definition rec.2.** Suppose  $f$  is a  $k$ -place function, and  $g_0, \dots, g_{k-1}$  are  $k$  functions which are all  $n$ -place. The function defined by *composition from  $f$  and  $g_0, \dots, g_{k-1}$*  is the  $n$ -place function  $h$  defined by

$$h(x_0, \dots, x_{n-1}) = f(g_0(x_0, \dots, x_{n-1}), \dots, g_{k-1}(x_0, \dots, x_{n-1})).$$

In addition to succ and the projection functions

$$P_i^n(x_0, \dots, x_{n-1}) = x_i,$$

for each natural number  $n$  and  $i < n$ , we will include among the primitive recursive functions the function  $\text{zero}(x) = 0$ .

**Definition rec.3.** The set of primitive recursive functions is the set of functions from  $\mathbb{N}^n$  to  $\mathbb{N}$ , defined inductively by the following clauses:

1. zero is primitive recursive.
2. succ is primitive recursive.
3. Each projection function  $P_i^n$  is primitive recursive.
4. If  $f$  is a  $k$ -place primitive recursive function and  $g_0, \dots, g_{k-1}$  are  $n$ -place primitive recursive functions, then the composition of  $f$  with  $g_0, \dots, g_{k-1}$  is primitive recursive.
5. If  $f$  is a  $k$ -place primitive recursive function and  $g$  is a  $k+2$ -place primitive recursive function, then the function defined by primitive recursion from  $f$  and  $g$  is primitive recursive.

Put more concisely, the set of primitive recursive functions is the smallest explanation set containing zero, succ, and the projection functions  $P_j^n$ , and which is closed under composition and primitive recursion.

Another way of describing the set of primitive recursive functions is by defining it in terms of “stages.” Let  $S_0$  denote the set of starting functions: zero, succ, and the projections. These are the primitive recursive functions of stage 0. Once a stage  $S_i$  has been defined, let  $S_{i+1}$  be the set of all functions

you get by applying a single instance of composition or primitive recursion to functions already in  $S_i$ . Then

$$S = \bigcup_{i \in \mathbb{N}} S_i$$

is the set of all primitive recursive functions

Let us verify that add is a primitive recursive function.

**Proposition rec.4.** *The addition function  $\text{add}(x, y) = x + y$  is primitive recursive.*

*Proof.* We already have a primitive recursive definition of add in terms of two functions  $f$  and  $g$  which matches the format of [Definition rec.1](#):

$$\begin{aligned} \text{add}(x_0, 0) &= f(x_0) = x_0 \\ \text{add}(x_0, y + 1) &= g(x_0, y, \text{add}(x_0, y)) = \text{succ}(\text{add}(x_0, y)) \end{aligned}$$

So add is primitive recursive provided  $f$  and  $g$  are as well.  $f(x_0) = x_0 = P_0^1(x_0)$ , and the projection functions count as primitive recursive, so  $f$  is primitive recursive. The function  $g$  is the three-place function  $g(x_0, y, z)$  defined by

$$g(x_0, y, z) = \text{succ}(z).$$

This does not yet tell us that  $g$  is primitive recursive, since  $g$  and  $\text{succ}$  are not quite the same function:  $\text{succ}$  is one-place, and  $g$  has to be three-place. But we can define  $g$  “officially” by composition as

$$g(x_0, y, z) = \text{succ}(P_2^3(x_0, y, z))$$

Since  $\text{succ}$  and  $P_2^3$  count as primitive recursive functions,  $g$  does as well, since it can be defined by composition from primitive recursive functions.  $\square$

**Proposition rec.5.** *The multiplication function  $\text{mult}(x, y) = x \cdot y$  is primitive recursive.*

[cmp:rec:prf:](#)  
[prop:mult-pr](#)

*Proof.* Exercise.  $\square$

**Problem rec.1.** Prove [Proposition rec.5](#) by showing that the primitive recursive definition of  $\text{mult}$  can be put into the form required by [Definition rec.1](#) and showing that the corresponding functions  $f$  and  $g$  are primitive recursive.

**Example rec.6.** Here’s our very first example of a primitive recursive definition:

$$\begin{aligned} h(0) &= 1 \\ h(y + 1) &= 2 \cdot h(y). \end{aligned}$$

This function cannot fit into the form required by [Definition rec.1](#), since  $k = 0$ . The definition also involves the constants 1 and 2. To get around the first problem, let's introduce a dummy argument and define the function  $h'$ :

$$\begin{aligned} h'(x_0, 0) &= f(x_0) = 1 \\ h'(x_0, y + 1) &= g(x_0, y, h'(x_0, y)) = 2 \cdot h'(x_0, y). \end{aligned}$$

The function  $f(x_0) = 1$  can be defined from `succ` and `zero` by composition:  $f(x_0) = \text{succ}(\text{zero}(x_0))$ . The function  $g$  can be defined by composition from  $g'(z) = 2 \cdot z$  and projections:

$$g(x_0, y, z) = g'(P_2^3(x_0, y, z))$$

and  $g'$  in turn can be defined by composition as

$$g'(z) = \text{mult}(g''(z), P_0^1(z))$$

and

$$g''(z) = \text{succ}(f(z)),$$

where  $f$  is as above:  $f(z) = \text{succ}(\text{zero}(z))$ . Now that we have  $h'$ , we can use composition again to let  $h(y) = h'(P_0^1(y), P_0^1(y))$ . This shows that  $h$  can be defined from the basic functions using a sequence of compositions and primitive recursions, so  $h$  is primitive recursive.
