tcp.1 Axiomatizable Complete Theories are Decidable

inc:tcp:cdc: A theory is said to be *complete* if for every sentence φ , either φ or $\neg \varphi$ is provable.

Lemma tcp.1. Suppose a theory \mathbf{T} is complete and axiomatizable. Then \mathbf{T} is decidable.

Proof. Suppose \mathbf{T} is complete and A is a computable set of axioms. If \mathbf{T} is inconsistent, it is clearly computable. (Algorithm: "just say yes.") So we can assume that \mathbf{T} is also consistent.

To decide whether or not a sentence φ is in **T**, simultaneously search for a derivation of φ from **T** and a derivation of $\neg \varphi$. Since **T** is complete, you are bound to find one or the other; and since **T** is consistent, if you find a derivation of $\neg \varphi$, there is no derivation of φ .

Put in different terms, we already know that \mathbf{T} is c.e.; so by a theorem we proved before, it suffices to show that the complement of \mathbf{T} is c.e. also. But a formula φ is in $\mathbf{\overline{T}}$ if and only if $\neg \varphi$ is in \mathbf{T} ; so $\mathbf{\overline{T}} \leq_m \mathbf{T}$.
