prf.1  Showing Systems are Distinct

In ?? we saw how to prove that two systems of modal logic are in fact the same system. ?? allows us to show that two modal systems $\Sigma$ and $\Sigma'$ are distinct, by finding a formula $\varphi$ such that $\Sigma' \vdash \varphi$ that fails in a model of $\Sigma$.

Proposition prf.1. KD $\subseteq$ KT

Proof. This is the syntactic counterpart to the semantic fact that all reflexive relations are serial. To show $\text{KD} \subseteq \text{KT}$ we need to see that $\text{KD} \vdash \psi$ implies $\text{KT} \vdash \psi$, which follows from $\text{KT} \vdash \text{D}$, as shown in ???. To show that the inclusion is proper, by Soundness (??), it suffices to exhibit a model of $\text{KD}$ where $\text{T}$, i.e., $\Box p \rightarrow p$, fails (an easy task left as an exercise), for then by Soundness $\text{KD} \not\models \Box p \rightarrow p$. \qed

Proposition prf.2. KB $\neq$ K4.

Proof. We construct a symmetric model where some instance of 4 fails; since obviously the instance is derivable for K4 but not in KB, it will follow K4 $\not\subseteq$ KB. Consider the symmetric model $\mathfrak{M}$ of Figure 1. Since the model is symmetric, K and B are true in $\mathfrak{M}$ (by ?? and ??, respectively). However, $\mathfrak{M}, w_1 \not\models \Box p \rightarrow \Box \Box p$.

Theorem prf.3. KTB $\not\models$ 4 and KTB $\not\models$ 5.

Proof. By ?? we know that all instances of T and B are true in every reflexive symmetric model (respectively). So by soundness, it suffices to find a reflexive symmetric model containing a world at which some instance of 4 fails, and similarly for 5. We use the same model for both claims. Consider the symmetric, reflexive model in Figure 2. Then $\mathfrak{M}, w_1 \not\models \Box p \rightarrow \Box \Box p$, so 4 fails at $w_1$. Similarly, $\mathfrak{M}, w_2 \not\models \Diamond \neg p \rightarrow \Box \Diamond \neg p$, so the instance of 5 with $\varphi = \neg p$ fails at $w_2$. \qed

Theorem prf.4. KD5 $\neq$ KT4 = S4.

Proof. By ?? we know that all instances of D and 5 are true in all serial euclidean models. So it suffices to find a serial euclidean model containing a world at which some instance of 4 fails. Consider the model of Figure 3, and notice that $\mathfrak{M}, w_1 \not\models \Box p \rightarrow \Box \Box p$.
