

met.1 Second-order Arithmetic

sol:met:spa:
sec Recall that the theory **PA** of Peano arithmetic includes the eight axioms of **Q**,

$$\begin{aligned} \forall x x' &\neq 0 \\ \forall x \forall y (x' = y' &\rightarrow x = y) \\ \forall x \forall y (x < y &\leftrightarrow \exists z (x + z') = y) \\ \forall x (x + 0) &= x \\ \forall x \forall y (x + y') &= (x + y)' \\ \forall x (x \times 0) &= 0 \\ \forall x \forall y (x \times y') &= ((x \times y) + x) \end{aligned}$$

plus all sentences of the form

$$(\varphi(0) \wedge \forall x (\varphi(x) \rightarrow \varphi(x'))) \rightarrow \forall x \varphi(x)$$

The latter is a “schema,” i.e., a pattern that generates infinitely many **sentences** of the language of arithmetic, one for each **formula** $\varphi(x)$. We call this schema the (first-order) *axiom schema of induction*. In *second-order* Peano arithmetic **PA²**, induction can be stated as a single sentence. **PA²** consists of the first eight axioms above plus the (second-order) *induction axiom*:

$$\forall X (X(0) \wedge \forall x (X(x) \rightarrow X(x'))) \rightarrow \forall x X(x)$$

It says that if a subset X of the **domain** contains $0^{\mathfrak{M}}$ and with any $x \in |\mathfrak{M}|$ also contains $\iota^{\mathfrak{M}}(x)$ (i.e., it is “closed under successor”) it contains everything in the **domain** (i.e., $X = |\mathfrak{M}|$).

The induction axiom guarantees that any **structure** satisfying it contains only those **elements** of $|\mathfrak{M}|$ the axioms require to be there, i.e., the values of \bar{n} for $n \in \mathbb{N}$. A model of **PA²** contains no non-standard numbers.

sol:met:spa:
thm:sol-pa-standard **Theorem met.1.** *If $\mathfrak{M} \models \mathbf{PA}^2$ then $|\mathfrak{M}| = \{\text{Val}^n(M) : n \in \mathbb{N}\}$.*

Proof. Let $N = \{\text{Val}^{\mathfrak{M}}(\bar{n}) : n \in \mathbb{N}\}$, and suppose $\mathfrak{M} \models \mathbf{PA}^2$. Of course, for any $n \in \mathbb{N}$, $\text{Val}^{\mathfrak{M}}(\bar{n}) \in |\mathfrak{M}|$, so $N \subseteq |\mathfrak{M}|$.

Now for inclusion in the other direction. Consider a variable assignment s with $s(X) = N$. By assumption,

$$\begin{aligned} \mathfrak{M} &\models \forall X (X(0) \wedge \forall x (X(x) \rightarrow X(x'))) \rightarrow \forall x X(x), \text{ thus} \\ \mathfrak{M}, s &\models (X(0) \wedge \forall x (X(x) \rightarrow X(x'))) \rightarrow \forall x X(x). \end{aligned}$$

Consider the antecedent of this conditional. $\text{Val}^{\mathfrak{M}}(0) \in N$, and so $\mathfrak{M}, s \models X(0)$. The second conjunct, $\forall x (X(x) \rightarrow X(x'))$ is also satisfied. For suppose $x \in N$. By definition of N , $x = \text{Val}^{\mathfrak{M}}(\bar{n})$ for some n . That gives $\iota^{\mathfrak{M}}(x) = \text{Val}^{\mathfrak{M}}(\overline{n+1}) \in N$. So, $\iota^{\mathfrak{M}}(x) \in N$.

We have that $\mathfrak{M}, s \models X(0) \wedge \forall x (X(x) \rightarrow X(x'))$. Consequently, $\mathfrak{M}, s \models \forall x X(x)$. But that means that for every $x \in |\mathfrak{M}|$ we have $x \in s(X) = N$. So, $|\mathfrak{M}| \subseteq N$. \square

Corollary met.2. *Any two models of \mathbf{PA}^2 are isomorphic.*

*sol:met:spa:
cor:sol-pa-categorical*

Proof. By [Theorem met.1](#), the domain of any model of \mathbf{PA}^2 is exhausted by $\text{Val}^{\mathfrak{M}}(\bar{n})$. Any such model is also a model of \mathbf{Q} . By [??](#), any such model is standard, i.e., isomorphic to \mathfrak{N} . \square

Above we defined \mathbf{PA}^2 as the theory that contains the first eight arithmetical axioms plus the second-order induction axiom. In fact, thanks to the expressive power of second-order logic, only the *first two* of the arithmetical axioms plus induction are needed for second-order Peano arithmetic.

Proposition met.3. *Let $\mathbf{PA}^{2\ddagger}$ be the second-order theory containing the first two arithmetical axioms (the successor axioms) and the second-order induction axiom. $>$, $+$, and \times are definable in $\mathbf{PA}^{2\ddagger}$.*

*sol:met:spa:
prop:sol-pa-definable*

Proof. Exercise. \square

Problem met.1. Prove [Proposition met.3](#).

Corollary met.4. $\mathfrak{M} \models \mathbf{PA}^2$ iff $\mathfrak{M} \models \mathbf{PA}^{2\ddagger}$.

Proof. Immediate from [Proposition met.3](#). \square
