

## fun.1 Isomorphism

sfr:fun:iso:  
sec An *isomorphism* is a bijection that preserves the structure of the sets it relates, where structure is a matter of the relationships that obtain between the **elements** of the sets. Consider the following two sets  $X = \{1, 2, 3\}$  and  $Y = \{4, 5, 6\}$ . These sets are both structured by the relations successor, less than, and greater than. An isomorphism between the two sets is a **bijection** that preserves those structures. So a **bijective** function  $f: X \rightarrow Y$  is an isomorphism if,  $i < j$  iff  $f(i) < f(j)$ ,  $i > j$  iff  $f(i) > f(j)$ , and  $j$  is the successor of  $i$  iff  $f(j)$  is the successor of  $f(i)$ . explanation

**Definition fun.1** (Isomorphism). Let  $U$  be the pair  $\langle X, R \rangle$  and  $V$  be the pair  $\langle Y, S \rangle$  such that  $X$  and  $Y$  are sets and  $R$  and  $S$  are relations on  $X$  and  $Y$  respectively. A **bijection**  $f$  from  $X$  to  $Y$  is an *isomorphism* from  $U$  to  $V$  iff it preserves the relational structure, that is, for any  $x_1$  and  $x_2$  in  $X$ ,  $\langle x_1, x_2 \rangle \in R$  iff  $\langle f(x_1), f(x_2) \rangle \in S$ .

**Example fun.2.** Consider the following two sets  $X = \{1, 2, 3\}$  and  $Y = \{4, 5, 6\}$ , and the relations less than and greater than. The function  $f: X \rightarrow Y$  where  $f(x) = 7 - x$  is an isomorphism between  $\langle X, < \rangle$  and  $\langle Y, > \rangle$ .
