

siz.1 Comparing Sizes of Sets

sfr:siz:car:
sec

Just like we were able to make precise when two sets have the same size in a way that also accounts for the size of infinite sets, we can also compare the sizes of sets in a precise way. Our definition of “is smaller than (or equinumerous)” will require, instead of a **bijection** between the sets, a total **injective** function from the first set to the second. If such a function exists, the size of the first set is less than or equal to the size of the second. Intuitively, an **injective** function from one set to another guarantees that the range of the function has at least as many elements as the domain, since no two **elements** of the domain map to the same **element** of the range.

explanation

Definition siz.1. X is *no larger than* Y , $X \preceq Y$, if and only if there is an **injective** function $f: X \rightarrow Y$.

Theorem siz.2 (Schröder-Bernstein). *Let X and Y be sets. If $X \preceq Y$ and $Y \preceq X$, then $X \approx Y$.*

In other words, if there is a total **injective** function from X to Y , and if there is a total **injective** function from Y back to X , then there is a total **bijection** from X to Y . Sometimes, it can be difficult to think of a **bijection** between two equinumerous sets, so the Schröder-Bernstein theorem allows us to break the comparison down into cases so we only have to think of an **injection** from the first to the second, and vice-versa. The Schröder-Bernstein theorem, apart from being convenient, justifies the act of discussing the “sizes” of sets, for it tells us that set cardinalities have the familiar anti-symmetric property that numbers have.

explanation

Definition siz.3. X is *smaller than* Y , $X \prec Y$, if and only if there is an **injective** function $f: X \rightarrow Y$ but no **bijection** $g: X \rightarrow Y$.

thm:cantor

Theorem siz.4 (Cantor). *For all X , $X \prec \wp(X)$.*

Proof. The function $f: X \rightarrow \wp(X)$ that maps any $x \in X$ to its singleton $\{x\}$ is **injective**, since if $x \neq y$ then also $f(x) = \{x\} \neq \{y\} = f(y)$.

There cannot be a **surjective** function $g: X \rightarrow \wp(X)$, let alone a **bijection** one. For suppose that $g: X \rightarrow \wp(X)$. Since g is total, every $x \in X$ is mapped to a subset $g(x) \subseteq X$. We show that g cannot be surjective. To do this, we define a subset $Y \subseteq X$ which by definition cannot be in the range of g . Let

$$\bar{Y} = \{x \in X : x \notin g(x)\}.$$

Since $g(x)$ is defined for all $x \in X$, \bar{Y} is clearly a well-defined subset of X . But, it cannot be in the range of g . Let $x \in X$ be arbitrary, we show that $\bar{Y} \neq g(x)$. If $x \in g(x)$, then it does not satisfy $x \notin g(x)$, and so by the definition of \bar{Y} , we have $x \notin \bar{Y}$. If $x \in \bar{Y}$, it must satisfy the defining property of \bar{Y} , i.e., $x \notin g(x)$. Since x was arbitrary this shows that for each $x \in X$, $x \in g(x)$ iff $x \notin \bar{Y}$, and so $g(x) \neq \bar{Y}$. So \bar{Y} cannot be in the range of g , contradicting the assumption that g is surjective. \square

explanation It's instructive to compare the proof of [Theorem 14.4](#) to that of [??](#). There we showed that for any list Z_1, Z_2, \dots , of subsets of \mathbb{Z}^+ one can construct a set \bar{Z} of numbers guaranteed not to be on the list. It was guaranteed not to be on the list because, for every $n \in \mathbb{Z}^+$, $n \in Z_n$ iff $n \notin \bar{Z}$. This way, there is always some number that is **an element** of one of Z_n and \bar{Z} but not the other. We follow the same idea here, except the indices n are now **elements** of X instead of \mathbb{Z}^+ . The set \bar{Y} is defined so that it is different from $g(x)$ for each $x \in X$, because $x \in g(x)$ iff $x \notin \bar{Y}$. Again, there is always **an element** of X which is **an element** of one of $g(x)$ and \bar{Y} but not the other. And just as \bar{Z} therefore cannot be on the list Z_1, Z_2, \dots , \bar{Y} cannot be in the range of g .

Problem 14.1. Show that there cannot be **an injective** function $g: \wp(X) \rightarrow X$, for any set X . Hint: Suppose $g: \wp(X) \rightarrow X$ is **injective**. Then for each $x \in X$ there is at most one $Y \subseteq X$ such that $g(Y) = x$. Define a set \bar{Y} such that for every $x \in X$, $g(\bar{Y}) \neq x$.
