

com.1 The Compactness Theorem

fol:com:com:
sec

One important consequence of the completeness theorem is the compactness theorem. The compactness theorem states that if each *finite* subset of a set of **sentences** is satisfiable, the entire set is satisfiable—even if the set itself is infinite. This is far from obvious. There is nothing that seems to rule out, at first glance at least, the possibility of there being infinite sets of **sentences** which are contradictory, but the contradiction only arises, so to speak, from the infinite number. The compactness theorem says that such a scenario can be ruled out: there are no unsatisfiable infinite sets of **sentences** each finite subset of which is satisfiable. Like the completeness theorem, it has a version related to entailment: if an infinite set of **sentences** entails something, already a finite subset does.

Definition com.1. A set Γ of **formulas** is *finitely satisfiable* iff every finite $\Gamma_0 \subseteq \Gamma$ is satisfiable.

thm:compactness

Theorem com.2 (Compactness Theorem). *The following hold for any sentences Γ and φ :*

1. $\Gamma \models \varphi$ iff there is a finite $\Gamma_0 \subseteq \Gamma$ such that $\Gamma_0 \models \varphi$.
2. Γ is satisfiable iff it is finitely satisfiable.

Proof. We prove (2). If Γ is satisfiable, then there is a **structure** \mathfrak{M} such that $\mathfrak{M} \models \varphi$ for all $\varphi \in \Gamma$. Of course, this \mathfrak{M} also satisfies every finite subset of Γ , so Γ is finitely satisfiable.

Now suppose that Γ is finitely satisfiable. Then every finite subset $\Gamma_0 \subseteq \Gamma$ is satisfiable. By soundness (????????????), every finite subset is consistent. Then Γ itself must be consistent by ??????????????. By completeness (??), since Γ is consistent, it is satisfiable. \square

Problem com.1. Prove (1) of **Theorem com.2**.

Example com.3. In every model \mathfrak{M} of a theory Γ , each term t of course picks out an **element** of $|\mathfrak{M}|$. Can we guarantee that it is also true that every **element** of $|\mathfrak{M}|$ is picked out by some term or other? In other words, are there theories Γ all models of which are covered? The compactness theorem shows that this is not the case if Γ has infinite models. Here's how to see this: Let \mathfrak{M} be an infinite model of Γ , and let c be a **constant symbol** not in the language of Γ . Let Δ be the set of all sentences $c \neq t$ for t a term in the language \mathcal{L} of Γ , i.e.,

$$\Delta = \{c \neq t : t \in \text{Trm}(\mathcal{L})\}.$$

A finite subset of $\Gamma \cup \Delta$ can be written as $\Gamma' \cup \Delta'$, with $\Gamma' \subseteq \Gamma$ and $\Delta' \subseteq \Delta$. Since Δ' is finite, it can contain only finitely many terms. Let $a \in |\mathfrak{M}|$ be an **element** of $|\mathfrak{M}|$ not picked out by any of them, and let \mathfrak{M}' be the **structure** that is just like \mathfrak{M} , but also $c^{\mathfrak{M}'} = a$. Since $a \neq \text{Val}^{\mathfrak{M}}(t)$ for all t occurring

in Δ' , $\mathfrak{M}' \models \Delta'$. Since $\mathfrak{M} \models \Gamma$, $\Gamma' \subseteq \Gamma$, and c does not occur in Γ , also $\mathfrak{M}' \models \Gamma'$. Together, $\mathfrak{M}' \models \Gamma' \cup \Delta'$ for every finite subset $\Gamma' \cup \Delta'$ of $\Gamma \cup \Delta$. So every finite subset of $\Gamma \cup \Delta$ is satisfiable. By compactness, $\Gamma \cup \Delta$ itself is satisfiable. So there are models $\mathfrak{M} \models \Gamma \cup \Delta$. Every such \mathfrak{M} is a model of Γ , but is not covered, since $\text{Val}^{\mathfrak{M}}(c) \neq \text{Val}^{\mathfrak{M}}(t)$ for all terms t of \mathcal{L} .

Example com.4. Consider a language \mathcal{L} containing the predicate symbol $<$, constant symbols 0 , 1 , and function symbols $+$, \times , and $-$. Let Γ be the set of all sentences in this language true in the structure \mathfrak{Q} with domain \mathbb{Q} and the obvious interpretations. Γ is the set of all sentences of \mathcal{L} true about the rational numbers. Of course, in \mathbb{Q} (and even in \mathbb{R}), there are no numbers r which are greater than 0 but less than $1/k$ for all $k \in \mathbb{Z}^+$. Such a number, if it existed, would be an *infinitesimal*: non-zero, but infinitely small. The compactness theorem can be used to show that there are models of Γ in which infinitesimals exist. We do not have a function symbol for division in our language (division by zero is undefined, and function symbols have to be interpreted by total functions). However, we can still express that $r < 1/k$, since this is the case iff $r \cdot k < 1$. Now let c be a new constant symbol and let Δ be

$$\{0 < c\} \cup \{c \times \bar{k} < 1 : k \in \mathbb{Z}^+\}$$

(where $\bar{k} = (1 + (1 + \dots + (1 + 1) \dots))$ with k 1's). For any finite subset Δ_0 of Δ there is a K such that for all the sentences $c \times \bar{k} < 1$ in Δ_0 have $k < K$. If we expand \mathfrak{Q} to \mathfrak{Q}' with $c^{\mathfrak{Q}'} = 1/K$ we have that $\mathfrak{Q}' \models \Gamma \cup \Delta_0$, and so $\Gamma \cup \Delta$ is finitely satisfiable (Exercise: prove this in detail). By compactness, $\Gamma \cup \Delta$ is satisfiable. Any model \mathfrak{S} of $\Gamma \cup \Delta$ contains an infinitesimal, namely $c^{\mathfrak{S}}$.

Problem com.2. In the standard model of arithmetic \mathfrak{N} , there is no element $k \in |\mathfrak{N}|$ which satisfies every formula $\bar{n} < x$ (where \bar{n} is $0^{l\dots l}$ with n 1's). Use the compactness theorem to show that the set of sentences in the language of arithmetic which are true in the standard model of arithmetic \mathfrak{N} are also true in a structure \mathfrak{N}' that contains an element which *does* satisfy every formula $\bar{n} < x$.

Example com.5. We know that first-order logic with identity predicate can express that the size of the domain must have some minimal size: The sentence $\varphi_{\geq n}$ (which says “there are at least n distinct objects”) is true only in structures where $|\mathfrak{M}|$ has at least n objects. So if we take

$$\Delta = \{\varphi_{\geq n} : n \geq 1\}$$

then any model of Δ must be infinite. Thus, we can guarantee that a theory only has infinite models by adding Δ to it: the models of $\Gamma \cup \Delta$ are all and only the infinite models of Γ .

So first-order logic can express infinitude. The compactness theorem shows that it cannot express finitude, however. For suppose some set of sentences Λ were satisfied in all and only finite structures. Then $\Delta \cup \Lambda$ is finitely satisfiable.

Why? Suppose $\Delta' \cup A' \subseteq \Delta \cup A$ is finite with $\Delta' \subseteq \Delta$ and $A' \subseteq A$. Let n be the largest number such that $\varphi_{\geq n} \in \Delta'$. A , being satisfied in all finite structures, has a model \mathfrak{M} with finitely many but $\geq n$ elements. But then $\mathfrak{M} \models \Delta' \cup A'$. By compactness, $\Delta \cup A$ has an infinite model, contradicting the assumption that A is satisfied only in finite structures.
