

syn.1 Introduction

fol:syn:itx:
sec In order to develop the theory and metatheory of first-order logic, we must first define the syntax and semantics of its expressions. The expressions of first-order logic are terms and **formulas**. Terms are formed from **variables**, **constant symbols**, and **function symbols**. **Formulas**, in turn, are formed from **predicate symbols** together with terms (these form the smallest, “atomic” **formulas**), and then from atomic **formulas** we can form more complex ones using logical connectives and quantifiers. There are many different ways to set down the formation rules; we give just one possible one. Other systems will chose different symbols, will select different sets of connectives as primitive, will use parentheses differently (or even not at all, as in the case of so-called Polish notation). What all approaches have in common, though, is that the formation rules define the set of terms and **formulas** *inductively*. If done properly, every expression can result essentially in only one way according to the formation rules. The inductive definition resulting in expressions that are *uniquely readable* means we can give meanings to these expressions using the same method—inductive definition.
