met.1 Second-order Logic is not Compact

Call a set of sentences $\Gamma$ finitely satisfiable if every one of its finite subsets is satisfiable. First-order logic has the property that if a set of sentences $\Gamma$ is finitely satisfiable, it is satisfiable. This property is called compactness. It has an equivalent version involving entailment: if $\Gamma \vdash \varphi$, then already $\Gamma_0 \vdash \varphi$ for some finite subset $\Gamma_0 \subseteq \Gamma$. In this version it is an immediate corollary of the completeness theorem: for if $\Gamma \vdash \varphi$, by completeness $\Gamma \vdash \varphi$. But a derivation can only make use of finitely many sentences of $\Gamma$.

Compactness is not true for second-order logic. There are sets of second-order sentences that are finitely satisfiable but not satisfiable, and that entail some $\varphi$ without a finite subset entailing $\varphi$.

**Theorem met.1.** Second-order logic is not compact.

**Proof.** Recall that

$$\text{Inf} \equiv \exists u (\forall x \forall y (u(x) = u(y) \rightarrow x = y) \land \exists y x \neq u(x))$$

is satisfied in a structure iff its domain is infinite. Let $\varphi^2_n$ be a sentence that asserts that the domain has at least $n$ elements, e.g.,

$$\varphi^2_n \equiv \exists x_1 \ldots \exists x_n (x_1 \neq x_2 \land x_1 \neq x_3 \land \cdots \land x_{n-1} \neq x_n).$$

Consider the set of sentences

$$\Gamma = \{ \neg \text{Inf}, \varphi^2_1, \varphi^2_2, \varphi^2_3, \ldots \}.$$ 

It is finitely satisfiable, since for any finite subset $\Gamma_0 \subseteq \Gamma$ there is some $k$ so that $\varphi^2_k \in \Gamma$ but no $\varphi^2_n \in \Gamma$ for $n > k$. If $|\mathcal{M}|$ has $k$ elements, $\mathcal{M} \models \Gamma_0$. But, $\Gamma$ is not satisfiable: if $\mathcal{M} \models \neg \text{Inf}$, $|\mathcal{M}|$ must be finite, say, of size $k$. Then $\mathcal{M} \models \neg \varphi^2_{k+1}$.

**Problem met.1.** Give an example of a set $\Gamma$ and a sentence $\varphi$ so that $\Gamma \models \varphi$ but for every finite subset $\Gamma_0 \subseteq \Gamma$, $\Gamma_0 \not\models \varphi$.
